Cell Proliferation / Cytotoxicity Assay

Cell Counting Kit-8 Cytotoxicity LDH Assay Kit-WST

Cell Counting Kit-8

Cytotoxicity LDH Assay Kit-WST

Detection Principle

Cell Counting Kit-8 measures the dehydrogenase activity with NADH in a live cell.

Cytotoxicity LDH Assay Kit-WST measures the LDH released by dead cells. when the plasma membrane is destructed.

Simultaneous Usage of CCK-8 and Cytotoxicity LDH Assay Kit-WST

Drug: Mitomycin C Cell Line: HeLa

Media: MEM, 10% FBS

Incubation: 37°C, 5% CO₂ for 48 hours

Measuring Condition: Cell Counting Kit-8 (450 nm)

Cytotoxicity LDH Assay Kit-WST (490 nm)

Simple Procedure

· Cell Counting Kit-8

· Cytotoxicity LDH Assay Kit-WST

Same Samples can be used

Since same samples can be used for Cell Counting Kit-8 and Cytotoxicity LDH Assay Kit-WST, the method is convenient and time efficient.

DAPGreen / Red - Autophagy Detection DALGreen - Autophagy Detection

DAPGreen and DAPRed detect autophagosomes, while DALGreen detects autolysosomes. These dyes are permeable to cells and enables live cell imaging with fluorescence microscopy, and DAPGreen and DALGreen allow for quantitative assay by flow cytometry. Autophagy is an intracellular degradation system involving autophagosome formation, detected by DAPGreen and DAPRed, and lysosome fusion, detected by DALGreen, which fluoresces intensity increases in acidic conditions.

Feature of Each Dye

	Appl Fluorescent Microscope	icable instrum Flow cytometer	ents Microplate reader	Fluorescent properties	Volume / the number of usable assays	Existing methods
DAPGreen	✓	✓	✓	Ex = 425-475 nm Em = 500-560 nm * For confocal microscope, the sample can be excited at 488 nm	5 nmol x 1 / 35 mm dish: 25 (when used in 1.0 µmol/l)	LC3-GFP MDC
DAPRed	✓			Ex = 500-560 nm Em = 690-750 nm	5 nmol x 1 / 35 mm dish: 25 (when used in 1.0 μmol/l)	Cyto-ID etc.
DALGreen	✓	✓		Ex = 350-450 nm Em = 500-560 nm * For confocal microscope,the sample can be excited at 488 nm	20 nmol x 1 / 35 mm dish: 10 (when used in 1.0 µmol/l)	LC3-GFP-RFP etc.

^{*}Double staining imaging by DAPGreen and DALGreen is not possible

Proliferation Cytotoxicity

Autophagic Flux Assay Kit Aggregated proteins Formation of

Experimental Example: Autophagy Flux Analysis

By culturing HeLa cells in HBSS with starvation, autophagy was induced and DAPRed and DALGreen fluorescence increased. Addition of Baf. A1 decreased DALGreen fluorescence, indicating that autolysosomes were reduced and Autophagy Flux was inhibited.

Quantification method: Fluorescence values (area) were obtained in Image J and normalized by the number of cells per field of view*. Number of samples: n=3 *Please obtain images with the same number of cells per field of view as possible.

Oxidative Stress

ROS Assay Kit -Highly Sensitive DCFH-DA-

ROS Assav Kit -Highly Sensitive DCFH-DA- overcomes these limitations. The dve allows ROS detection with higher sensitivity than DCFH-DA. Moreover, the Loading Buffer included in this kit maintains cellular health during assays.

The reactivity of the Highly Sensitive DCFH-DA for ROS is similar to the reactivity of 2'-7' dichlorofluorescein diacetate (DCFH-DA). The Highly Sensitive DCFH-DA also has similar fluorescence characteristics (λ_{ex} : 505 nm, λ_{em} : 525 nm) to DCFH-DA. Therefore. ROS is detectable at the same excitation/fluorescence wavelength.

The selectivity for ROS

High Sensitive Detection Compared with DCFH-DA

Detection using fluorescent microscope

Detection using microplate reader

Hydrogen peroxide (H₂O₂)-treated HeLa cells (1×10⁴ cells/ml) were stained with DCFH-DA or the ROS Assav Kit-Highly Sensitive DCFH-DA, and the fluorescence intensity of intracellular ROS was compared between two detection kits. As a result, the ROS Assav Kit-Highly Sensitive DCFH-DA in high-sensitivity detection of intracellular ROS was better than DCFH-DA.

Description	Unit	Code
ROS Assay Kit -Highly Sensitive DCFH-DA-	100 tests	R252-10

ROS Assay Kit -Photo-oxidation Resistant DCFH-DA-

The dve that is employed in this kit allows ROS detection with higher sensitivity than DCFH-DA: It does not leak from cells because the fluorescent dye

can immobilize protein via a chemical bond, and it is resistant to photo-oxidation compared with DCFH-DA. Moreover, the Loading Buffer in the kit maintains cellular health during assays. Time-lapse imaging movie Available

Other Probe

Resistant to Photo-oxidation

Simultaneous Detection of ROS in LPS-treated macrophages

Photo-oxidation

Resistant DCFH-DA

In Lipopolysaccharide (LPS) treated RAW 264.7 cells, after being stained with regular DCFH-DA, Highly Sensitive DCFH-DA, or Photo-oxidation Resistant DCFH-DA, the intracellular ROS level was compared. The results showed that the Dojindo Laboratories' probes could detect intracellular ROS with higher sensitivity.

Lipid Peroxide Detection

Liperfluo

Liperfluo is a Dojindo-developed fluorescence probe to specifically detect lipid peroxides with minimal photo-damage or auto-fluorescence. It emits intense fluorescence in organic solvents and is nearly non-fluorescent in aqueous media. Liperfluo's tetraethyleneglycol group increases its solubility and makes it suitable for imaging lipid peroxides in cell membranes. It's used to monitor lipid peroxidation in ferroptosis research through fluorescence microscopy and flow cytometry.

Excitation and emission without lipid peroxide spectra of Liperfluo with or without lipid peroxide in ethanol.

Lipid Peroxide Detection in Living Cells

Liperfluo added to cells, t-BHP induced lipid peroxidation and cells were observed under confocal microscope to study ferroptosis.

Lipid Peroxidation Probe -BDP 581/591 C11-

Lipid Peroxidation Probe -BDP 581/591 C11- is a fluorescent probe for detecting lipid peroxidation. This fluorescent probe does not react with lipid peroxides but reacts with lipid radicals generated when lipids are peroxidized, resulting in the detection of lipid peroxidation. The unreacted probe emits red fluorescence, but after reacting with radicals around lipids, it changes its fluorescence from red to green. Thus, lipid peroxidation can be detected with high sensitivity because it is detected by the ratio of red to green fluorescence intensity.

Lipid Peroxidation Assay

<Experimental Conditions> Fluorescent Microscope

Green: GFP filter (Ex = 450-490 nm, Em = 500-550 nm) Red: TexasRed filter (Ex = 540-580 nm. Em = 600-660 nm)

Scale bar: 50 µm

Fluorescent Plate Reader

Green: Ex = 490 nm. Em = 520-540 nmRed: Ex = 570 nm. Em = 600-620 nm

HepG2 cells stained with this probe were stimulated with HBSS solution containing 200 µmol/l t-BHP for 2 hours, and the fluorescence intensity was compared with control cells. As a result, a decrease in red fluorescence and an increase in green fluorescence were observed with high sensitivity in t-BHP-treated cells compared to untreated cells. The cells were detected using a plate reader, and the values obtained were calculated as the intensity ratio of green/red fluorescence, which allowed quantified lipid peroxidation. Furthermore, an increase in the histogram of green fluorescence was observed when the cells were detected using a flow cytometer. Which improves that this dye is three different instruments.

Quantification of Reduced (GSH) and Oxidized (GSSG) Glutathione

GSSG/GSH Quantification Kit

The GSSG/GSH Quantification kit contains Masking Reagent of GSH. GSH will be deactivated in the sample by simply adding the Masking Reagent. Then, using the enzymatic recycling system, only the GSSG will be detected by measuring the absorbance (λ max = 412 nm) of DTNB (5,5-dithio-bis- (2-nitrobenzoic acid). The quantity of GSH can also be determined, by substracting GSSG from the total amount of glutathione. With this kit, GSH/GSSG concentrations from 0.5 μ mol/l to 50 μ mol/l and GSSG concentrations from 0.5 μ mol/l to 25 μ mol/l can be quantified.

Assay Procedure

 GSSG/GSH Standard Solution and add Sample A or Sample B to each well.

2) Add Buffer solution to each well

3) Incubate at 37°C for 1 h.

 4)-5) Add substrate working solution and Enzyme/ Coenzyme working solution to

6)-7) After incubating at 37°C for 10 minutes, measure the absorbane of each well with a microplate.

Simple Procedure for First Time User

For a first-time user, the kit includes the reagents and components necessary for measuring samples. You'll soon realize how easy it is to use.

Intracellular Metabolism

Glycolysis/JC-1 MitoMP Assay Kit

- Two indicators can be measured in one sample (Lactate production and mitochondrial membrane potential)
- Easy-to-understand detailed protocol

Intracellular metabolic changes caused by any stimulations can be detected by measuring lactate production and mitochondrial membrane potential. In certain instances, cells manage to survive despite sustaining damage to their glycolytic system or mitochondrial function, the principal pathways for energy production. It is understood that this occurs as cells strive to persist and prevent cell death by augmenting glycolysis even when mitochondrial function is compromised, or by activating mitochondrial function when glycolysis is impaired.

Experimental Example:

Intracellular metabolic changes in HeLa cells treated with the glycolytic inhibitor 2-Deoxy-D-glucose

When we evaluated cell viability in 2-DG-treated HeLa cells using the CCK-8* assay, we observed minimal changes in viability. However, given the observed decrease in lactate production, it prompted us to question how cell viability was maintained in spite of glycolytic system inhibition. To answer this, we examined the mitochondrial membrane potential using the JC-1 Assay. The results from this investigation suggest that HeLa cells preserve their survival by boosting mitochondrial function when the glycolytic system is inhibited by 2-DG.

* Cell Counting Kit-8 (product code: CK04) is not included in this kit.

Description	Unit	Code
Glycolysis/JC-1 MitoMP Assay Kit	50 tests	G272-10

Proliferation Cytotoxicity

• Easy test via plate reader, no need for expensive equipment

- All reagent acquired is included, ready to use kit
- Easy-to-understand detailed protocol

Combining methods (1) and (2) can be used to measure the metabolic pathway dependency of cells. Cells are treated with oligomycin or 2-DG to inhibit OXPHOS or ATP synthesis in the glycolytic pathway, and the amounts of ATP and lactate production are measured, respectively. Changes in the amount of ATP can be used to determine the efficiency of energy production, and changes in the amount of lactate produced can be used to determine changes in glycolytic capacity and evaluate whether cells are dependent on glycolysis or OXPHOS.

Experimental Example:

Comparison of metabolic pathway dependence in different cell line

Description	Unit	Code
Glycolysis/OXPHOS Assay Kit	50 tests	G270-10

Lysosome

Intracellular Metabolism

Glucose Uptake Assay Kit

- Highly sensitive and simple measurement of glucose uptake capacity
- Applicable for microscopy & FCM
- Reduces dye leakage after staining

Glucose Uptake Probe allowing highly sensitive detection of cellular glucose uptake by fluorescence imaging or flow cytometry. The WI Solution in this kit can enhance cellular retention to provide more reliable experimental data. Also, compare with the existing method (2-NBDG), the measurement time can be significantly reduced.

Comparison with Existing Method

The comparison of the Glucose Uptake Probe Series and the existing method(2-NBDG) is as below.

product name	Fluorescence microscope	Plate reader detection	FCM detection	Retention ability	Fluorescence characteristics
Glucose Uptake Assay Kit-Blue	0	×	0	1 hour *	λ _{ex} :386 nm λ _{em} :474 nm
Glucose Uptake Assay Kit-Green	0	0	0	1 hour *	λ _{ex} :507 nm λ _{em} :518 nm
Glucose Uptake Assay Kit-Red	0	0	0	1 hour *	λex:560 nm λem:572 nm
2-NBDG	0	×	0	30 minutes or less *	λ _{ex} :465 nm λ _{em} :540 nm

*Result of A549 cells, the retention time for other cell lines may be different.

Description	Unit	Code
Glucose Uptake Assay Kit-Blue	1 set	UP01-10
Glucose Uptake Assay Kit-Green	1 set	UP02-10
Glucose Uptake Assay Kit-Red	1 set	UP03-10

Cystine Uptake Assay Kit

Applied for plate assay

The Cystine Analog (CA) in this kit can be taken up into cells via xCT, and the incorporated CA can be specifically detected using the Fluorescent Probe and Reducing Agent. Thus, the xCT activity can be measured easily.[Patent applied]

Evaluation of xCT inhibitor Sulfasalazine or Erastin

Using this kit, we measured the inhibitory effect of sulfasalazine and erastin on cystine uptake by HeLa cells. The fluorescence intensity of the sulfasalazine and elastin groups decreased significantly, indicating that both reagents inhibit cystine uptake.

Experiment Condiitons

Cell Line: HeLa cells

Pretreatment: DMEM (cystine-free, serum-free), 37°C, 5 min Uptake conditions; 0.5 mmol/l sulfasalazine or 2 µmol/l erastin / Cystine Analog / DMEM (cystine-free, serum-free), 37°C, 30 min

Instrument: Fluorescent Plate Reader Filter: Ex=485 nm. Em=535 nm

Description	Unit	Code
Custing Untaka Assau Kit	20 tests	UP05-10
Cystine Uptake Assay Kit	100 tests	UP05-12

Mitochondrial Research

Mitochondrial Research

Extracellular OCR Plate Assay Kit

- Applicable to regular fluorescent plate reader with temperature-controlled incubation
- No need for an expensive instrument, special medium, and plates
- All-in-One Kit with OCR calculation Sheets

Procedure

Comparison with Flux Analyzer

Flux Analyzer (XFe24) and this kit were measured on the same day under the same conditions (cell type, cell number, and FCCP concentration).

As a result, correlated data of oxygen consumption rate changes were obtained for XFe24 and this kit.

Cells: HepG2
Cell Number: 5×10⁴ cells/well
Stimulation: FCCP (Carbonyl cyanide
4-(trifluoromethoxy) phenylhydrazone)
FCCP Concentration: 2 µmol/l

	Description	Unit	Code
Extracellular OCR Plate Assay Kit		100 tests	E297-10

Mitochondrial Membrane Potential Detection

JC-1 MitoMP Detection Kit

JC-1 forms aggregate (in healthy mitochondria) with red fluorescence. As membrane potential decreases, JC-1 becomes monomers, which shows in green fluorescence. The change in ratio of red to green fluorescence is used as a indicator of mitochondrial condition.

De	escription	Unit	Code
JC-1 MitoMP Detection Kit		1 set	MT09-10

Mitochondrial Membrane Potential Detection

MT-1 MitoMP Detection Kit

JC-1 dye, TMRE, and TMRM are widely used to monitor MMP, however, these dyes have some limitations, such as low photostability and poor retention after aldehyde fixation. These limitations result in poor reproducibility of experiments. Dojindo's MT-1 MitoMP Detection Kit overcomes these limitations. In addition, the Imaging Buffer included in this kit minimizes background fluorescence and maintains cell vitality while the assay is being performed.

High Sensitivity Detection

Allow to monitor mitochondrial membrane potential

Description	Unit	Code
MT-1 MitoMP Detection Kit	1 set	MT13-10

Mitochondrial Research

Mitophagy Detection Kit

This kit is composed of Mtphagy Dye, reagent for detection of mitophagy, and Lyso Dye. Mtphagy Dye accumulates in intact mitochondria, is immobilized on it with chemical bond and exhibits a weak fluorescence from the influence of surrounding condition. When Mitophagy is induced, the damaged mitochondria fuses to lysosome and then Mtphagy Dye emits a high fluorescence. To confirm the fusion of Mtphagy Dye—labeled mitochondria and lysosome, Lyso Dye included in this kit can be used.

The fluorescent intensity of Mtphagy Dye is incresased at pH 4-5.

Mitophagy Induction and Mitochondrial Membrane Potential Changes

Mitochondrial condition in the carbonyl cyanide m-chlorophenyl hydrazine (CCCP) treated Parkin-expressing HeLa cells was compared with untreated cells using Mitophagy Detection Kit (MD01, MT02) and JC-1 MitoMP Detection Kit (MT09). Result:

As a result, mitophagy was hardly detected in the CCCP-untreated cells, and mitochondrial membrane potential was maintained normally. On the other hand, in CCCP-treated cells, we observed a decrease in mitochondrial membrane potential (decrease in red fluorescence of JC-1)

and induction of mitophagy (increase in fluorescence of Mtphagy Dye).

Description	Unit	Code
Mitophagy Detection Kit	1 set	MD01-10
Mtphagy Dye	5 μg × 3	MT02-10

Endocytosis

Mitochondrial Superoxide Detection

MitoBright ROS Deep Red - Mitochondrial Superoxide Detection

This dye emits deep red fluorescence; its fluorescence does not overlap with emission wavelengths that other red fluorescent markers use. Furthermore, the MitoBright ROS Deep Red is better able to selectively detect superoxide, compared to Company T's product Red.

Experimental Example

Simultaneously Evaluation of Mitochondrial Superoxide and Membrane Potential

<lmaging Conditions>
(Confocal microscopy)
JC-1: Green Ex = 488, Em = 490-520 nm,
Red: Ex = 561, Em = 560-600 nm
MitoBright ROS Deep Red: Ex = 633 nm,
Em = 640-700 nm
Scale bar: 10 µm

After HeLa cells were washed with HBSS, co-stained with MitoBright ROS Deep Red and mitochondrial membrane potential staining dye (JC-1: code MT09), and the generated mitochondrial ROS and membrane potential were observed simultaneously. As a result, the decrease in mitochondrial membrane potential and the generation of mitochondrial ROS are simultaneously observed.

Description	Unit	Code
Mita Prinkt DOC Dean Rad Mitashandrial Compresside Detection	100 nmol \times 1	MT16-10
MitoBright ROS Deep Red - Mitochondrial Superoxide Detection	100 nmol × 3	MT16-12

Mitochondrial Superoxide Detection

Mito-FerroGreen

Mito-FerroGreen is a novel fluorescent probe for the detection of ferrous ion (Fe²⁺) in mitochondria where Fe-S clusters and heme proteins are synthesized, and enables live cell fluorescent imaging of intracellular Fe²⁺. Mito-FerroGreen has no no chelating ability. Mito-FerroGreen and Fe²⁺ react irreversibly, which is different from the detection principle of calcium-iron probes such as Fluo-3.

Double staining with mitochondrial staining probe

HeLa cells incubated with Mito-FerroGreen and MitoBright Deep Red, treated with ammonium iron(II) sulfate, were observed by fluorescence microscopy.

Double staining with mitocondrial staining probe Mito-FerroGreen (5 µmol/l) Ex/Em = 488 nm/ 500-550 nm MitoBright Deep Red (200 nmol/l) Ex/Em = 640 nm/ 656-700 nm A Mito-FerroGreen B MitoBright Deep Red

Excitation (\lambda ex): 644 nm

Emission (\(\lambda\ext{ex}\): 666 nm

650 700

MitoBright LT dves are designed to exhibit mitochondria retention for long-term visualization. In addition, the MitoBright LT dves show stronger fluorescence signals compared with other commercially available dves that contain the chloromethyl moiety. The MitoBright LT dves offer three different color options (Green, Red and Deep Red), and are provided as a ready-to-use DMSO solution. A working solution can easily be prepared in a single dilution step with growth medium or HBSS.

Stained in serum-contained media

HeLa cells were stained with MitoBright LTs or an existing reagent and observed after 4 days. MitoBright LT remained unchanged and observable even after 7 days, while the existing reagent's intensity decreased.

Fluorescence Properties
