## Cell Counting Kit-8 Cytotoxicity LDH Assay Kit-WST

Cell Counting Kit-8

Cytotoxicity LDH Assay Kit-WST

#### **Detection Principle**

Cell Counting Kit-8 measures the dehydrogenase activity with NADH in a live cell.

Cytotoxicity LDH Assay Kit-WST measures the LDH released by dead cells. when the plasma membrane is destructed.

## Simultaneous Usage of CCK-8 and Cytotoxicity LDH Assay Kit-WST

Drug: Mitomycin C Cell Line: HeLa

Media: MEM, 10% FBS

Incubation: 37°C, 5% CO<sub>2</sub> for 48 hours

Measuring Condition: Cell Counting Kit-8 (450 nm)

Cytotoxicity LDH Assay Kit-WST (490 nm)

## **Simple Procedure**

#### · Cell Counting Kit-8

#### · Cytotoxicity LDH Assay Kit-WST

#### Same Samples can be used

Since same samples can be used for Cell Counting Kit-8 and Cytotoxicity LDH Assay Kit-WST, the method is convenient and time efficient.

#### **Senescence Detection**

## Cellular Senescence Detection Kit - SPiDER-βGal Cellular Senescence Detection Kit - SPiDER Blue NEW

Cellular Senescence Detection Kit – SPiDER- $\beta$ Gal allows to detect SA- $\beta$ -gal with high sensitivity and ease of use. SPiDER- $\beta$ Gal is a new reagent to detect  $\beta$ -galactosidase which possesses a high cell-permeability and a high retentivity inside cells. SA- $\beta$ -gal are detected specifically not only in living cells but also fixed cells by using a reagent (Bafilomycin A1) to inhibit endogenous  $\beta$ -galactosidase activity. Therefore, SPiDER- $\beta$ Gal can be applied to quantitative analysis by flow cytometry.

## Co-staining of SA- β-gal and DNA Damage marker in WI-38 cells

WI-38 cells were treated with anti- y-H2AX antibody and observed under a confocal microscope. The procedure involved several steps, including fixing the cells, permeabilizing, blocking, adding primary and secondary antibodies, staining with DAPI, and washing the cells. The experiment aimed to detect DNA damage and study DNA repair pathways.

Cellular Senescence Detection Kit - SPiDER-βGal	10 assays	SG03-10
Cellular Senescence Detection Kit - SPiDER Blue	1 Plate	SG07-10

## Cellular Senescence Plate Assay Kit - SPiDER-\(\beta\)Gal

This product is a simple detection kit by plate assay for senescence-associated β-galactosidase (SA-β-gal) activity which is used as a marker for senescent cells. By simply adding SPiDER-βGal, a reagent for detection of β-galactosidase, to 96 well plates, this kit allows you to quantify SA-β-gal activity and makes it possible to evaluate multiple samples. When normalization is done by the results obtained by counting cells, quantifying nucleic acids (a relevant product), or quantifying proteins, the measured values obtained using this kit become available for evaluating SA-β-gal activity according to cell number.

## **Correlation with Imaging Data**

Plate Assav Ex. 535nm / Em. 580nm

#### Imaging data

Green: Ex. 488nm / Em. 500-600nm (SA-β-Gal staining with Cellular Senescence Detection Kit – SPiDER-\(\beta\)Gal(Code SG04)) Blue: Ex. 405nm / Em. 450-495nm (Nuclear staining with -Cellstain- DAPI solution(Code D523))

As a result, it was confirmed that in both kits, SA-β-gal staining increased in the high-passage WI-38 cells. Bear in mind that although initial cell seeding densities are the same, cell densities at the time of plate assay differ due to low proliferation rate of senescent cells at higher passage levels. Therefore, in this experiment, we used SA-β-Gal activity values normalized by the results obtained using the Cell Count Normalization Kit in which cell number is determined by a nuclear marker.

## **Cell Count Normalization Kit**

Cell Count Normalization Kit includes nucleic acid staining dye, Hoechst 33342 which binds to nuclear DNA to emit blue fluorescence. By measuring this blue fluorescence, correction of the measured value can easily be carried out in simple steps whereas the visual cell counting method requires complicated procedure. Moreover, unlike the correction by protein or ATP amount, the kit requires no lysis procedure. In addition, Quenching Buffer included in the kit enables a direct measuring of fluorescence signal without any background.

## DAPGreen / Red - Autophagy Detection DALGreen - Autophagy Detection

DAPGreen and DAPRed detect autophagosomes, while DALGreen detects autolysosomes. These dyes are permeable to cells and enables live cell imaging with fluorescence microscopy, and DAPGreen and DALGreen allow for quantitative assay by flow cytometry. Autophagy is an intracellular degradation system involving autophagosome formation, detected by DAPGreen and DAPRed, and lysosome fusion, detected by DALGreen, which fluoresces intensity increases in acidic conditions.

### **Feature of Each Dye**

	Appl Fluorescent Microscope	icable instrum Flow cytometer	ents Microplate reader	Fluorescent properties	Volume / the number of usable assays	Existing methods
DAPGreen	✓	✓	✓	Ex = 425-475 nm Em = 500-560 nm * For confocal microscope, the sample can be excited at 488 nm	5 nmol x 1 / 35 mm dish: 25 (when used in 1.0 µmol/l)	LC3-GFP
DAPRed	✓			Ex = 500-560 nm Em = 690-750 nm	5 nmol x 1 / 35 mm dish: 25 (when used in 1.0 μmol/l)	MDC Cyto-ID etc.
DALGreen	✓	✓		Ex = 350-450 nm Em = 500-560 nm * For confocal microscope,the sample can be excited at 488 nm	20 nmol x 1 / 35 mm dish: 10 (when used in 1.0 µmol/l)	LC3-GFP-RFP etc.

<sup>\*</sup>Double staining imaging by DAPGreen and DALGreen is not possible

Proliferation Cytotoxicity

**Autophagic Flux Assay Kit** Aggregated proteins Formation of

Experimental Example: Autophagy Flux Analysis

By culturing HeLa cells in HBSS with starvation, autophagy was induced and DAPRed and DALGreen fluorescence increased. Addition of Baf. A1 decreased DALGreen fluorescence, indicating that autolysosomes were reduced and Autophagy Flux was inhibited.

Quantification method: Fluorescence values (area) were obtained in Image J and normalized by the number of cells per field of view\*. Number of samples: n=3 \*Please obtain images with the same number of cells per field of view as possible.

#### Oxidative Stress

## **ROS Assay Kit -Highly Sensitive DCFH-DA-**

ROS Assav Kit -Highly Sensitive DCFH-DA- overcomes these limitations. The dve allows ROS detection with higher sensitivity than DCFH-DA. Moreover, the Loading Buffer included in this kit maintains cellular health during assays.

The reactivity of the Highly Sensitive DCFH-DA for ROS is similar to the reactivity of 2'-7' dichlorofluorescein diacetate (DCFH-DA). The Highly Sensitive DCFH-DA also has similar fluorescence characteristics ( $\lambda_{ex}$ : 505 nm,  $\lambda_{em}$ : 525 nm) to DCFH-DA. Therefore. ROS is detectable at the same excitation/fluorescence wavelength.

## The selectivity for ROS

### **High Sensitive Detection Compared with DCFH-DA**

Detection using fluorescent microscope

Detection using microplate reader

Hydrogen peroxide (H<sub>2</sub>O<sub>2</sub>)-treated HeLa cells (1×10<sup>4</sup> cells/ml) were stained with DCFH-DA or the ROS Assav Kit-Highly Sensitive DCFH-DA, and the fluorescence intensity of intracellular ROS was compared between two detection kits. As a result, the ROS Assav Kit-Highly Sensitive DCFH-DA in high-sensitivity detection of intracellular ROS was better than DCFH-DA.

Description	Unit	Code
ROS Assay Kit -Highly Sensitive DCFH-DA-	100 tests	R252-10

## **ROS Assay Kit -Photo-oxidation Resistant DCFH-DA-**

The dve that is employed in this kit allows ROS detection with higher sensitivity than DCFH-DA: It does not leak from cells because the fluorescent dye

## can immobilize protein via a chemical bond, and it is resistant to photo-oxidation compared with DCFH-DA. Moreover, the Loading Buffer in the kit maintains cellular health during assays. Time-lapse imaging movie Available

Other Probe

#### Resistant to Photo-oxidation

## Simultaneous Detection of ROS in LPS-treated macrophages

Photo-oxidation

Resistant DCFH-DA

In Lipopolysaccharide (LPS) treated RAW 264.7 cells, after being stained with regular DCFH-DA, Highly Sensitive DCFH-DA, or Photo-oxidation Resistant DCFH-DA, the intracellular ROS level was compared. The results showed that the Dojindo Laboratories' probes could detect intracellular ROS with higher sensitivity.

Description	Unit	Code
ROS Assay Kit -Photo-oxidation Resistant DCFH-DA-	100 tests	R253-10

#### **Lipid Peroxide Detection**

## Liperfluo

Liperfluo is a Dojindo-developed fluorescence probe to specifically detect lipid peroxides with minimal photo-damage or auto-fluorescence. It emits intense fluorescence in organic solvents and is nearly non-fluorescent in aqueous media. Liperfluo's tetraethyleneglycol group increases its solubility and makes it suitable for imaging lipid peroxides in cell membranes. It's used to monitor lipid peroxidation in ferroptosis research through fluorescence microscopy and flow cytometry.

Excitation and emission without lipid peroxide spectra of Liperfluo with or without lipid peroxide in ethanol.

## **Lipid Peroxide Detection in Living Cells**

Liperfluo added to cells, t-BHP induced lipid peroxidation and cells were observed under confocal microscope to study ferroptosis.

**Lipid Peroxidation Probe -BDP 581/591 C11-**

Lipid Peroxidation Probe -BDP 581/591 C11- is a fluorescent probe for detecting lipid peroxidation. This fluorescent probe does not react with lipid peroxides but reacts with lipid radicals generated when lipids are peroxidized, resulting in the detection of lipid peroxidation. The unreacted probe emits red fluorescence, but after reacting with radicals around lipids, it changes its fluorescence from red to green. Thus, lipid peroxidation can be detected with high sensitivity because it is detected by the ratio of red to green fluorescence intensity.

## **Lipid Peroxidation Assay**

<Experimental Conditions> Fluorescent Microscope

Green: GFP filter (Ex = 450-490 nm, Em = 500-550 nm) Red: TexasRed filter (Ex = 540-580 nm. Em = 600-660 nm)

Scale bar: 50 µm

Fluorescent Plate Reader

Green: Ex = 490 nm. Em = 520-540 nmRed: Ex = 570 nm. Em = 600-620 nm

HepG2 cells stained with this probe were stimulated with HBSS solution containing 200 µmol/l t-BHP for 2 hours, and the fluorescence intensity was compared with control cells. As a result, a decrease in red fluorescence and an increase in green fluorescence were observed with high sensitivity in t-BHP-treated cells compared to untreated cells. The cells were detected using a plate reader, and the values obtained were calculated as the intensity ratio of green/red fluorescence, which allowed quantified lipid peroxidation. Furthermore, an increase in the histogram of green fluorescence was observed when the cells were detected using a flow cytometer. Which improves that this dye is three different instruments.

Endocytosis

#### Intracellular Iron Ion Measurement

## **FerroOrange**

Liperfluo is a Dojindo-developed fluorescence probe to specifically detect lipid peroxides with minimal photo-damage or auto-fluorescence. It emits intense fluorescence in organic solvents and is nearly non-fluorescent in aqueous media. Liperfluo's tetraethyleneglycol group increases its solubility and makes it suitable for imaging lipid peroxides in cell membranes. It's used to monitor lipid peroxidation in ferroptosis research through fluorescence microscopy and flow cytometry.

#### **Experimental Example**

HeLa cells treated with chelator of iron 2,2'-bipyridyl (Bpy) (100  $\mu$ mol/l) or Ammonium iron (II) sulfate (100  $\mu$ mol/l) were prepared. The change of intracellular Fe<sup>2+</sup> in HeLa cells was detected by the FerroOrange. Ex = 561 nm, Em = 570-620 nm, Scale bars 20  $\mu$ m

Description	Unit	Code
Farra O-200-0-2	1 tube	F374-10
FerroOrange	3 tube	F374-12

#### Quantification of Reduced (GSH) and Oxidized (GSSG) Glutathione

## **GSSG/GSH Quantification Kit**

The GSSG/GSH Quantification kit contains Masking Reagent of GSH. GSH will be deactivated in the sample by simply adding the Masking Reagent. Then, using the enzymatic recycling system, only the GSSG will be detected by measuring the absorbance ( $\lambda$ max = 412 nm) of DTNB (5,5-dithio-bis- (2-nitrobenzoic acid). The quantity of GSH can also be determined, by substracting GSSG from the total amount of glutathione. With this kit, GSH/GSSG concentrations from 0.5  $\mu$ mol/l to 50  $\mu$ mol/l and GSSG concentrations from 0.5  $\mu$ mol/l to 25  $\mu$ mol/l can be quantified.

#### **Assay Procedure**

 GSSG/GSH Standard Solution and add Sample A or Sample B to each well.

2) Add Buffer solution to each well

3) Incubate at 37°C for 1 h.

 4)-5) Add substrate working solution and Enzyme/ Coenzyme working solution to

6)-7) After incubating at 37°C for 10 minutes, measure the absorbane of each well with a microplate.

#### **Calibration Curve**

## **Simple Procedure for First Time User**

For a first-time user, the kit includes the reagents and components necessary for measuring samples. You'll soon realize how easy it is to use.

Proliferation Cytotoxicity

• Easy test via plate reader, no need for expensive equipment

- All reagent acquired is included, ready to use kit
- Easy-to-understand detailed protocol

Combining methods (1) and (2) can be used to measure the metabolic pathway dependency of cells. Cells are treated with oligomycin or 2-DG to inhibit OXPHOS or ATP synthesis in the glycolytic pathway, and the amounts of ATP and lactate production are measured, respectively. Changes in the amount of ATP can be used to determine the efficiency of energy production, and changes in the amount of lactate produced can be used to determine changes in glycolytic capacity and evaluate whether cells are dependent on glycolysis or OXPHOS.

#### Experimental Example:

#### Comparison of metabolic pathway dependence in different cell line

Description	Unit	Code
Glycolysis/OXPHOS Assay Kit	50 tests	G270-10

## **Cystine Uptake Assay Kit**

Applied for plate assay

The Cystine Analog (CA) in this kit can be taken up into cells via xCT, and the incorporated CA can be specifically detected using the Fluorescent Probe and Reducing Agent. Thus, the xCT activity can be measured easily.[Patent applied]

### **Evaluation of xCT inhibitor Sulfasalazine or Erastin**

Using this kit, we measured the inhibitory effect of sulfasalazine and erastin on cystine uptake by HeLa cells. The fluorescence intensity of the sulfasalazine and elastin groups decreased significantly, indicating that both reagents inhibit cystine uptake.

**Experiment Condiitons** 

Cell Line: HeLa cells

Pretreatment: DMEM (cystine-free, serum-free), 37°C, 5 min Uptake conditions; 0.5 mmol/l sulfasalazine or 2 µmol/l erastin / Cystine Analog / DMEM (cystine-free, serum-free), 37°C, 30 min

Instrument: Fluorescent Plate Reader Filter: Ex=485 nm. Em=535 nm

Description	Unit	Code
Custing Untaka Assau Kit	20 tests	UP05-10
Cystine Uptake Assay Kit	100 tests	UP05-12

## **Mitochondrial Research**

#### **Mitochondrial Research**

## **Extracellular OCR Plate Assay Kit**

- Applicable to regular fluorescent plate reader with temperature-controlled incubation
- No need for an expensive instrument, special medium, and plates
- All-in-One Kit with OCR calculation Sheets

#### **Procedure**

#### **Comparison with Flux Analyzer**

Flux Analyzer (XFe24) and this kit were measured on the same day under the same conditions (cell type, cell number, and FCCP concentration).

As a result, correlated data of oxygen consumption rate changes were obtained for XFe24 and this kit.

Cells: HepG2
Cell Number: 5×10<sup>4</sup> cells/well
Stimulation: FCCP (Carbonyl cyanide
4-(trifluoromethoxy) phenylhydrazone)
FCCP Concentration: 2 µmol/l

	Description	Unit	Code
Extracellular OCR Plate Assay Kit		100 tests	E297-10

#### **Mitochondrial Membrane Potential Detection**

## **JC-1 MitoMP Detection Kit**

JC-1 forms aggregate (in healthy mitochondria) with red fluorescence. As membrane potential decreases, JC-1 becomes monomers, which shows in green fluorescence. The change in ratio of red to green fluorescence is used as a indicator of mitochondrial condition.

De	escription	Unit	Code
JC-1 MitoMP Detection Kit		1 set	MT09-10

#### **Mitochondrial Membrane Potential Detection**

## **MT-1 MitoMP Detection Kit**

JC-1 dye, TMRE, and TMRM are widely used to monitor MMP, however, these dyes have some limitations, such as low photostability and poor retention after aldehyde fixation. These limitations result in poor reproducibility of experiments. Dojindo's MT-1 MitoMP Detection Kit overcomes these limitations. In addition, the Imaging Buffer included in this kit minimizes background fluorescence and maintains cell vitality while the assay is being performed.

High Sensitivity Detection

Allow to monitor mitochondrial membrane potential

Description	Unit	Code
MT-1 MitoMP Detection Kit	1 set	MT13-10

#### **Mitochondrial Research**

## **Mitophagy Detection Kit**

This kit is composed of Mtphagy Dye, reagent for detection of mitophagy, and Lyso Dye. Mtphagy Dye accumulates in intact mitochondria, is immobilized on it with chemical bond and exhibits a weak fluorescence from the influence of surrounding condition. When Mitophagy is induced, the damaged mitochondria fuses to lysosome and then Mtphagy Dye emits a high fluorescence. To confirm the fusion of Mtphagy Dye—labeled mitochondria and lysosome, Lyso Dye included in this kit can be used.

The fluorescent intensity of Mtphagy Dye is incresased at pH 4-5.

## Mitophagy Induction and Mitochondrial Membrane Potential Changes

Mitochondrial condition in the carbonyl cyanide m-chlorophenyl hydrazine (CCCP) treated Parkin-expressing HeLa cells was compared with untreated cells using Mitophagy Detection Kit (MD01, MT02) and JC-1 MitoMP Detection Kit (MT09). Result:

As a result, mitophagy was hardly detected in the CCCP-untreated cells, and mitochondrial membrane potential was maintained normally. On the other hand, in CCCP-treated cells, we observed a decrease in mitochondrial membrane potential (decrease in red fluorescence of JC-1)

and induction of mitophagy (increase in fluorescence of Mtphagy Dye).

Description	Unit	Code
Mitophagy Detection Kit	1 set	MD01-10
Mtphagy Dye	5 μg × 3	MT02-10

Endocytosis

#### **Mitochondrial Superoxide Detection**

## MitoBright ROS Deep Red - Mitochondrial Superoxide Detection

This dye emits deep red fluorescence; its fluorescence does not overlap with emission wavelengths that other red fluorescent markers use. Furthermore, the MitoBright ROS Deep Red is better able to selectively detect superoxide, compared to Company T's product Red.

## Experimental Example

Simultaneously Evaluation of Mitochondrial Superoxide and Membrane Potential

<lmaging Conditions>
(Confocal microscopy)
JC-1: Green Ex = 488, Em = 490-520 nm,
Red: Ex = 561, Em = 560-600 nm
MitoBright ROS Deep Red: Ex = 633 nm,
Em = 640-700 nm
Scale bar: 10 µm

After HeLa cells were washed with HBSS, co-stained with MitoBright ROS Deep Red and mitochondrial membrane potential staining dye (JC-1: code MT09), and the generated mitochondrial ROS and membrane potential were observed simultaneously. As a result, the decrease in mitochondrial membrane potential and the generation of mitochondrial ROS are simultaneously observed.

Description	Unit	Code
Mita Prinkt DOC Dean Rad Mitashandrial Compravide Detection	100 nmol $\times$ 1	MT16-10
MitoBright ROS Deep Red - Mitochondrial Superoxide Detection	100 nmol × 3	MT16-12

## Mito-FerroGreen

Mito-FerroGreen is a novel fluorescent probe for the detection of ferrous ion (Fe<sup>2+</sup>) in mitochondria where Fe-S clusters and heme proteins are synthesized, and enables live cell fluorescent imaging of intracellular Fe<sup>2+</sup>. Mito-FerroGreen has no no chelating ability. Mito-FerroGreen and Fe<sup>2+</sup> react irreversibly, which is different from the detection principle of calcium-iron probes such as Fluo-3.

## Double staining with mitochondrial staining probe

HeLa cells incubated with Mito-FerroGreen and MitoBright Deep Red, treated with ammonium iron(II) sulfate, were observed by fluorescence microscopy.

Double staining with mitocondrial staining probe Mito-FerroGreen (5 µmol/l) Ex/Em = 488 nm/ 500-550 nm MitoBright Deep Red (200 nmol/l) Ex/Em = 640 nm/ 656-700 nm A Mito-FerroGreen B MitoBright Deep Red

MitoBright LT dves are designed to exhibit mitochondria retention for long-term visualization. In addition, the MitoBright LT dves show stronger fluorescence signals compared with other commercially available dves that contain the chloromethyl moiety. The MitoBright LT dves offer three different color options (Green, Red and Deep Red), and are provided as a ready-to-use DMSO solution. A working solution can easily be prepared in a single dilution step with growth medium or HBSS.

#### Stained in serum-contained media

HeLa cells were stained with MitoBright LTs or an existing reagent and observed after 4 days. MitoBright LT remained unchanged and observable even after 7 days, while the existing reagent's intensity decreased.

#### **Fluorescence Properties**

Description	Unit	Code
MitoBright LT Green	400 µl	MT10-12
MitoBright LT Red	400 μΙ	MT11-12
MitoBright LT Deep Red	400 μΙ	MT12-12

## **Lipid Droplet Staining** Lipi-Blue / Green / Red / Deep Red

Lipi probes are small molecules that emit strong fluorescence in a hydrophobic environment such as LDs, which can be observed without any washing steps after staining with Lipi probes.

A medium that contained oleic acid (200 µmol/l) was added and incubated overnight. Then, the supernatant was removed and the cells were washed with PBS. Each Lipi product series (1 µmol/l) was added and the cells were incubated for 15 minutes.

Lipi-Blue: Ex. 405 nm / Em. 450 - 500 nm, Lipi-Green: Ex. 488 nm / Em. 500 - 550 nm, Lipi-Red: Ex. 561 nm / Em. 565 - 650 nm, Lipi-Deep Red: Ex.640 nm / Em.650-700 nm

<sup>&</sup>lt;sup>\*2</sup> When co-staining with a green fluorescent dye, a green fluorescent emission filter less than 550 nm is recommended.

## Lipid Droplet Assay Kit - Blue / Deep Red

Senescence

Proliferation Cytotoxicity

Autophagy

The Lipid Droplet Assay Kit simplifies the quantification of fat droplets with provided protocols and buffers. It works for live cells, and its fluorescent dye is suitable for both live and fixed cells. Compared to colorimetric reagents, it reduces measuring time and increases experiment repeatability by avoiding dye deposition in the plate.

Description	Unit	Code
Lipid Droplet Assay Kit-Blue	1 set	LD05-10
Lipid Droplet Assay Kit-Deep Red	1 set	LD06-10
